## Fire detection specialists teams up with Böning

Sea-Fire has combined its fire detection equipment with Böning's ship alarm and monitoring systems. The two systems can now be integrated with RJ45 cables so that when a fire occurs, its position can be displayed on a touch screen relative to an overlay of the yacht's deck plan. This information can be used by the crew to quickly assess the problem and effect a response.

Böning Automationstechnologie produces systems for ship automation, alarm and monitoring products on commercial and pleasure craft. Sea-Fire produce fire suppression technology like the FM-200 clean agent fire extinguishers as well as fire detection sensors.
